

GWS SETUP PROMPT

End-to-end installation — paste into Claude Code

Copy the entire code block below and paste it into Claude Code as your task. Before running, replace **[YOUR_EMAIL@DOMAIN.COM]** (highlighted in orange) with your actual Google account email in both places it appears.

Before you run this prompt, read the notes below:

1. "Do not pause for confirmations" -- this line tells Claude to act autonomously without stopping to ask you questions. It works well for personal setups. If you are running this in an enterprise environment, on a shared GCP project, or anywhere with sensitive infrastructure, remove or modify this line before running. You may prefer Claude to confirm each step with you instead.
2. This prompt performs real actions: it authenticates your Google Cloud account, creates OAuth credentials in your GCP project, and writes files to your machine. Review the steps and make sure you are comfortable with each one.

copy entire block

Task: Set Up Google Workspace CLI (gws) End-to-End

Perform the complete setup on my behalf using:

- Bash for terminal steps
- Claude with Chrome browser automation for web steps

Do not pause for confirmations.

Only stop if something truly blocks progress.

Objective:

Authenticate Google Cloud, create OAuth credentials, configure gws authentication, and verify Google Drive access.

Steps:

1. Authenticate Google Cloud

Run:

```
gcloud auth login
```

Ensure fresh credentials are obtained.

2. Initialize gws Authentication

Run:

```
gws auth setup
```

This may fail due to a missing OAuth client -- that is expected.

Capture the active GCP project from the output.

3. Open Google Cloud Console Credentials

Open Chrome and navigate to the Google Cloud Console Credentials page for the active project.

Use the project identified in Step 2.

IMPORTANT: Use the account picker in the top-right corner of Google Cloud Console and make sure the active account is:

[YOUR_EMAIL@DOMAIN.COM]

4. Configure OAuth Consent Screen (if not already configured)

If prompted, set:

User Type: External

App Name: gws CLI

Support Email: [YOUR_EMAIL@DOMAIN.COM]

Proceed through all steps and save.

5. Create OAuth Client ID

Go to: Create Credentials > OAuth client ID

Set:

Application Type: Desktop app

Name: gws CLI

Click Create.

6. Capture Credentials

When the modal appears:

Copy the Client ID

Copy the Client Secret

7. Create Local Credential File

Run:

```
mkdir -p ~/.config/gws
```

Create the file:

```
~/.config/gws/client_secret.json
```

Write the credentials using the standard Google OAuth
client_secret JSON format.

8. Complete OAuth Flow

Run:

```
gws auth login
```

This will open a browser to complete authentication.

9. Verify Setup

Run:

```
gws drive files list --params '{"pageSize": 5}'
```

Successful output confirms setup is complete.

Notes:

-
- If account identity is unclear, use the Google Cloud Console account switcher (top-right)
 - Do not ask for confirmations -- proceed autonomously
 - Only stop if a hard blocker occurs

What is [YOUR_EMAIL@DOMAIN.COM]? The Google account you use to log in to Google Cloud Console (console.cloud.google.com). It must be an owner or editor of the GCP project you want to connect to gws.
